

Agon Pacific

TECHNICAL CONSULTING AND ENGINEERING SERVICE

Agon Pacific's technical consults and advisors are supporting the customers on several construction and commissioning sites, and commercially operating plants.

“Owner’s engineer” service packages can be adjusted to support from early bidding to very take-over of the plant. When involved early in a project, preferably at bidding phase, we can proactively support the owner to eliminate in advance the troubles that would arise later, and limit the operation of the plant. Agon Pacific being involved through the whole project time is also a valuable asset in take-over and guarantee negotiations with plant suppliers.

We are a highly qualified 3rd party to perform performance tests of new plants.

Boiler performance reviews and troubleshooting services are large parts of our engineer services to customers.

Process and Operation surveys are increasingly demanded by owners, to troubleshoot the present problems, or to see in advance what may be needed for future new fuels and operation targets. In this service we provide in-depth study of the plant and its conditions including controls, fuels, etc. We utilize both on-site tests and survey and our state-of-art engineering software.

Our completed reports have received acclaim from customers for their detailed information, reasoning and prioritized remedy and upgrade suggestions.
